

Meeting Intelligence Copilot

Ask better questions. Govern the solution. Verify the evidence.

Local-first Windows workbench for Japanese, English, and Korean meetings, documents, ERP, repositories, and enterprise context.

API v13

Source candidate

One public monorepo
One product identity
Read-only enterprise
boundaries

The live question loop

Deterministic meeting state remains authoritative

- Explicit language configuration only - no Unicode-range language guessing.
- Every pain point and fact retains transcript evidence event IDs.
- Connectors, RAG, and optional local models never delay ASK NOW.

One repository, one product

The desktop is now versioned with its API and schemas

apps/api

FastAPI, deterministic domain, adapters, gateway, recovery, and tests.

contracts + apps/web

Generated schemas and the small contract/demo client.

apps/desktop

Windows Tauri/Rust recorder, local STT, intelligence UI, and connector settings.

Product integration and enterprise intelligence by Nanakea

The capture foundation remains correctly attributed to Meetily under its MIT license. Legacy adapter/storage names stay only where compatibility requires them.

Connected evidence - never meeting truth

Selected sources, bounded retrieval, explicit review

Knowledge

Local files, Notion, SharePoint, OneDrive, Confluence

Delivery

GitHub, GitLab, Jira, Azure DevOps, ServiceNow

Operations

NetSuite, WMS, Amazon FBA, SAP, Dynamics, OData

Collaboration

Selected Teams and Slack spaces

- Local files may be encrypted and indexed; remote ERP/chat records remain live-only where required.
- Every citation shows a safe source reference, freshness, retrieval time, and not-stated-in-meeting boundary.
- Real tenant compatibility remains unverified until company sandbox acceptance.

Notion is implemented

Selected-page retrieval is now exposed in the desktop

1. Approve

Create an internal Notion connection with Read content only and No user information.

2. Select

Share only approved pages and enroll their UUIDs under safe labels.

3. Retrieve

Bounded GET-only markdown retrieval with redirects disabled and no remote-content cache.

What it cannot do

- Create, update, archive, comment on, or delete Notion content.
- Read pages that were not explicitly shared and selected.
- Turn Notion text into transcript evidence or automatically change meeting state.

Close the NetSuite -> WMS -> FBA gaps

Read-only reconciliation across operational handoffs

- Flags missing upstream/downstream records, quantity differences, duplicate keys, stale interfaces, and environment mismatches.
- Analyzes price, inventory, volume, fulfillment lead time, fill rate, and stockout trends with explicit currency isolation.
- Produces findings and reviewed exports only - no operational ERP or fulfillment mutations.

When documentation and systems disagree

Two-sided evidence, neutral attribution

Documented claim

Subject, property, expected value/type, revision, environment, exact citation.

Observed system fact

Repository/API/pipeline/ERP/CMDB value, revision, environment, freshness, citation.

Consistency finding

Deterministic comparison rule, likely impact, verification step, review state.

Neutral by default

The engine reports that sources disagree. A reviewed authority policy may later classify documentation drift, implementation drift, configuration drift, deployment lag, or an approved exception.

Security boundary

What company approval must permit - and what remains impossible

Request

Selected-source read permissions; local audio consent; Notion Read content; delegated Microsoft file reads; selected Teams/Slack search; repository read permissions; dedicated NetSuite/WMS/FBA read roles; approved SQL views, SFTP roots, and GET/HEAD API operations.

Never request

Remote delete; ERP operational writes; Slack/Teams posting; issue or work-item submission; unrestricted repository or tenant access; direct messages; arbitrary SQL; unpinned SFTP; POST/PUT/PATCH/DELETE OpenAPI operations; cloud AI transcript upload.

Current acceptance status

Strong source evidence, honest external gates

Green

588 API tests, 24 goldens, schema sync, web checks, 300-case Korean deterministic corpus.

Implemented, not tenant-proven

Notion, Microsoft 365, NetSuite, WMS, FBA, repositories, collaboration, RAG, consistency.

Open release gates

Renamed package rebuild, Sandbox lifecycle, routed Korean audio, signing, tenant acceptance, human pilot.

Do not call this production-ready yet.

It is a synthetic-tested, unsigned internal source candidate prepared for company approval and non-production validation.

First workday sequence

Start safe, validate narrowly, expand only with evidence

- 1 Policy** Confirm recording consent, retention, support owner, and allowed meeting types.
- 2 Local** Run preflight for language, local STT, audio paths, disk, sidecar, and panel delivery.
- 3 Knowledge** Approve one synthetic Notion page or local folder; verify zero write capability.
- 4 ERP** Use non-production NetSuite/WMS/FBA mappings and reconcile known synthetic handoffs.
- 5 Pilot** Run consented JA/EN/KO meetings, review every finding, and measure usefulness.
